List of Tables

1.1 Energy consumption worldwide in 2018 2
1.2 Network reconfiguration solution technique and its objective 11
1.3 Summary of DER planning studies 19

2.1 Test system information 39
2.2 Four scenarios 39
2.3 Simulation results of TS-1 and TS-2 under TVVC and four Scenarios . . . 41
2.4 optimal opened RCS of TS-1 and TS-2 under Scenario 3 and Scenario 4 . . 41
2.5 Performance of various algorithms for Scenario 4 at peak loading hour for TS-1 and TS-2 45
2.6 Performance of MBGWO and DICOPT for Scenario 4 at peak loading hour for TS-1 and TS-2 46
2.7 Simulation results of unbalanced 33 bus distribution system under TVVC and four Scenarios 48
2.8 simulations results of TS-1 and TS-2 under multiple line faults at peak demand 53
2.9 PV output during clear sky, partly and fully cloud day condition 54
2.10 Status of VVC devices, DNR and PVSI reactive power using proposed algorithm during 13:00 to 14:00 hours 54
2.11 Summary of results during clear sky, partly and full cloudy condition for TS-1 55
2.12 Summary of results during clear sky, partly and full cloudy condition for TS-2 56

3.1 value of k_p and k_q and their location 63

3.2 cost parameters . . . 64
3.3 summary of results under different cases . . . 66
3.4 status of RCS, OLTC and SCBs under case 2 to case 4 . . . 68
3.5 status of RCS, OLTC and SCBs under case 6 and case 7 . . . 73
3.6 Results of CGWO and proposed MBGWO . . . 79
3.7 Results of cost benefit analysis of SOP . . . 81
3.8 Cost benefit analysis in presence of high penetration of DG . . . 83

4.1 modified 33 bus distribution system information . . . 99
4.2 value of k_p and k_q and their location . . . 99
4.3 Cases studied . . . 100
4.4 Set of non-inferior solutions of the objectives OF1 and OF2 under case 2 and case3 . . . 102
4.5 set of non-inferior solutions of the objectives OF1 and OF2 under case 4 and case 5 . . . 106
4.6 Results of three different cases of 33 bus system . . . 106
4.7 load and PV output during clear sky, partly and fully cloud day condition 114
4.8 optimal setting of control devices using centralised control algorithm . . . 115

5.1 simulation results under different scenarios . . . 129
5.2 opened RCS under scenario 1 and 5 . . . 131
5.3 optimal scheduling of control devices obtained by centralised control stage at 14:00 hour . . . 133

6.1 Different cases studied . . . 150
6.2 Results of different cases over planning horizon . . . 151
6.3 Percentage power share between RES and grid in different cases . . . 151
6.4 Optimal location and size of DER and SOP for different cases at initial year 152
6.5 Optimal location and size of DER and SOP for different cases at initial year 153
6.6 Optimal capacities of DER and SOP for different cases in each year . . . 154
6.7 optimal opened RCS* of case C and case E in each year . . . 155
6.8 Performance of proposed hybrid solver and CGWO for case E . . . 159
