

# List of figures

1.1	Reach of renewable-based power from 2007 to 2016 [6]. . . . .	4
1.2	Growth in the capacity of different renewable-based off-grid systems [6] .	4
1.3	Applications of different types of wind turbine. . . . .	8
1.4	Block diagram Representation of a rooftop wind energy conversion system.	9
1.5	Block diagram representation of squirrel cage induction generator connected to the grid through an anti-parallel thyristor-based soft-starter. . . .	13
1.6	Wound rotor induction generator with extra resistance in the rotor circuit to control the speed of the generator. . . . .	14
1.7	Block diagram representation of a self-excited squirrel-cage induction generator. . . . .	14
1.8	Block diagram representation of a doubly-fed induction generator connected to the grid. . . . .	15
1.9	Permanent magnet synchronous generator-based wind energy conversion system with gearboxes. . . . .	16
1.10	Permanent magnet synchronous generator-based wind energy conversion system without gearboxes. . . . .	17
1.11	Axial-flux permanent magnet generator topologies [50]. . . . .	19
1.12	Stator laminations of an Axial-flux permanent magnet generator. . . . .	21
1.13	Axial-flux permanent magnet generator with segmented stator [53]. . . .	21

1.14	Magnetic gear, as proposed by Atallah et al. [55]. . . . .	22
1.15	Permanent magnet synchronous generator integrated to Grid through a two-level back-to-back power converter. . . . .	26
1.16	Three-level neutral-point diode clamped (NPC) back-to-back power converter. . . . .	28
1.17	Single-phase equivalent circuit diagram of three-level H-bridge (HB) back-to-back power converter. . . . .	29
1.18	Single-phase equivalent circuit diagram of Five-level H-bridge back-to-back power converter. . . . .	30
1.19	Two-level back-to-back H-bridge multicell converter connected in parallel and series. . . . .	31
1.20	Two-level back-to-back H-bridge multicell converter connected in series at generator end and parallel at grid end. . . . .	31
1.21	A transformer less topology using two-level back-to-back H-bridge converter and multi-winding generator topology with open windings. . . . .	32
2.1	Use of eddy current brakes to restrict the overspeed of generator. . . . .	36
2.2	Topological variations in electrically-excited variable flux permanent magnet machine. . . . .	38
2.3	A Doubly Excited Synchronous Machine with permanent magnets and DC field coils on the rotor [90]. . . . .	40
2.4	Hybrid stepper motor with series flux weakening without risking permanent magnets. . . . .	40
2.5	A Schematic diagram of the Consequent pole PM machine. . . . .	41
2.6	A 2-D diagram of imbricated hybrid synchronous machine. . . . .	42
2.7	Effect of shift of rotors with respect to other rotor in a dual-rotor topology. . . . .	45
2.8	A 2-D diagram of a dual-rotor sandwiched split-stator axial-flux PMSG . . . . .	46

---

2.9	A 2-D diagram of a switched-flux permanent magnet generator [128]. . . . .	47
2.10	2-D diagrams of mechanically switched-flux PM machine with different field-weakening position [129]. . . . .	48
2.11	2-D diagram of the rotor cross-section of an inserted PM on rotor type PMSG topology showing adjustable iron bar for field-weakening in the same [130]. . . . .	48
2.12	2-D diagram of the rotor cross-section of an inserted PM on rotor type PMSG topology showing adjustable weakening permanent magnets for field-weakening in the same [131]. . . . .	48
3.1	Pancake-shaped stator cores of topology T2 and T3. . . . .	53
3.2	Stators with tooth windings in topology T1. . . . .	56
3.3	Slot-vector diagram of 12 slots, 2 phase, 6 pole concentrated tooth winding. . . . .	56
3.4	Winding layout of 12 slots, 2 phase, 6 poles, double layer concentrated tooth winding. . . . .	57
3.5	Stators with distributed windings in topology T2. . . . .	59
3.6	Stators with distributed windings in topology T3. . . . .	59
3.7	Slot-vector diagram of 18 slots, 3 phase, 4 poles, double layer distributed winding. . . . .	60
3.8	Winding layout of 18 slots, 3 phase, 4 poles, double layer distributed winding. . . . .	61
3.9	Interconnections of Stationary Stator and Rotatable Stator windings. . . . .	62
3.10	Phasor diagrams of Stationary Stator and Rotatable Stator windings. . . . .	62
3.11	Plot of variation in generator output voltage (rms) as per stator displacement angle. . . . .	63
3.12	Variations in Generator phase voltage (rms) against stator displacement angle (mechanical degree) for a six pole generator at 1000 rpm rotor speed. . . . .	63

3.13	Flux path in the top-view of the DSAF PMSG. . . . .	64
3.14	Rotor fitted on the shaft through flange support and magnets pasted on both sides of the rotor surface. . . . .	65
3.15	Variations in Generator phase voltage against stator displacement angle (Stator bolted to a potting arrangement). . . . .	66
3.16	Stator-potting arrangement resting on the stepping on the shaft through ball-bearing. . . . .	66
3.17	Assembly of the dual-stator axial-flux permanent magnet synchronous generator with provision of displacing one of the stator with respect to the other stator. . . . .	68
4.1	Proposed rooftop wind energy conversion system with voltage regulation achieved via the mechanical field weakening method. . . . .	70
4.2	Simulated plot of turbine power vs rotor speed at different wind speed. . .	73
4.3	Simulated plot of power coefficient vs $\lambda$ for the wind turbine emulator. . .	73
4.4	Wind turbine characteristic and DC-motor characteristics at different chopper duty ratio . . . . .	74
4.5	Control circuit diagram of wind turbine emulator. . . . .	75
4.6	DC chopper circuit diagram. . . . .	76
4.7	DC motor armature current response during step change of wind velocity. . .	76
4.8	Rotor speed response during step change of wind velocity. . . . .	77
4.9	Wind turbine emulator performance. . . . .	77
5.1	Control circuit diagram of the proposed DC-link voltage controller. . . . .	82
5.2	Simplified mathematical model of stepper motor. . . . .	84
5.3	Simplified control circuit diagram of the Proposed system. . . . .	87
5.4	Final control circuit diagram of proposed controller. . . . .	87

---

6.1	Output no-load voltage waveform of Topology T1 at different stator displacement angles. . . . .	94
6.2	Output no-load voltage waveform of Topology T2 at different stator displacement angles. . . . .	95
6.3	Output no-load voltage waveform of Topology T3 at different stator displacement angles. . . . .	96
6.4	Output no-load voltage waveform of Topology T4 at different stator displacement angles. . . . .	97
6.5	Variations in Line voltage for trapezoidal, high peak sinusoidal, and near-to-sinusoidal back EMF characteristics as per angular shift of stator in electrical degree. . . . .	98
6.6	Magnitude of different order of harmonics present in line voltage of different generator topologies upon increase in stator displacement angle. . . .	99
6.7	THD content in line voltage of different generator topologies upon increase in stator displacement angle. . . . .	100
6.8	FFT analysis of generator current profile of Topology T3 at $SDA = 115^\circ$ .	101
6.9	Effect of mechanical field weakening in topology T3 at load at $SDA = 0^\circ$ .	102
6.10	Effect of mechanical field weakening in topology T3 at load at $SDA = 75^\circ$ .	103
6.11	Effect of mechanical field weakening in topology T3 at load at $SDA = 115^\circ$ .	104
6.12	Effect of mechanical field weakening in topology T2 at load at $SDA = 0^\circ$ .	105
6.13	Effect of mechanical field weakening in topology T2 at load at $SDA = 75^\circ$ .	106
6.14	Effect of mechanical field weakening in topology T2 at load at $SDA = 115^\circ$ .	107
6.15	Experimental results on proposed system under variable wind and supplying constant load. . . . .	111
6.16	Experimental results on proposed system under constant wind and supplying variable load. . . . .	114

---

6.17	Schematic diagram showing the effect of grid-fault on the system. . . . .	115
6.18	$V_{dc}$ voltage dynamics at fault. . . . .	119
7.1	Block diagram representation of proposed hybrid solar wind system. . . . .	125
7.2	Block diagram model of proposed rooftop hybrid solar wind system in wind supportive mode. . . . .	125
7.3	A typical wind profile during experimentation. . . . .	128
7.4	Performance evaluation of proposed hybrid solar-wind conversion system.	132
