

List of Figures

Figure Number	Title	Page No.
Figure 3.1 a	Divided channel method (Yen 2002).	67
Figure 3.1 b	Alternative way of dividing channel (Yen 2002)	67
Figure 4.1	A fish school dividing into two groups for their survival in the presence of a predator	86
Figure 4.2	Swarm diversity during search with (solid line) and without (dotted line) inertia weight (Adopted from Parsopoulos and Vrahatis 2010).	86
Figure 5.1	Schematic diagram of the canal having side slopes lined with loose riprap and bottom unlined.	112
Figure 5.2	Flow chart depicting Particle Swarm Optimization algorithm as applied to the problem.	113
Figure 5.3 a	The convergence trend of mean, local, and global dimensionless costs with iteration number for angular riprap stone for clear water flow condition near channel bottom.	114
Figure 5.3 b	The convergence trend of mean, local, and global dimensionless costs with iteration number for angular riprap stone for sediment laden flow condition near channel bottom.	115

Figure 5.4 a	The convergence trend of mean, local, and global dimensionless costs with iteration number for subround and subangular riprap stone for clear water flow condition near channel bottom.	116
Figure 5.4 b	The convergence trend of mean, local, and global dimensionless costs with iteration number for subround and subangular riprap stone for sediment laden flow condition near channel bottom.	117
Figure 5.5 a	The convergence trend of mean, local, and global dimensionless costs with iteration number for round riprap stone for clear water flow condition near channel bottom.	118
Figure 5.5 b	The convergence trend of mean, local, and global dimensionless costs with iteration number for round riprap stone for sediment laden flow condition near channel bottom.	119
Figure 7.1	Flow chart depicting application of fish shoal optimization algorithm to the problem .	152
Figure 7.2	Shoal characteristics with iterations for flow rate convergence representing involvement of members from all subgroups at each generation for canal without freeboard with parameter setting 1.	153

Figure 7.3	The convergence trend of local, mean and global leader costs with iterations for three freeboard scenarios with parameter setting 1.	154
Figure 7.4	Convergence characteristics of FSO led by different global leader (minima) from various subgroups with successive iterations for three freeboard scenarios with parameter setting 1.	155
Figure 7.5	The convergence characteristics for actual flow rate by global leaders emerging out from various subgroups with successive iterations for three different freeboard scenarios with parameter setting 1.	156
Figure 7.6 a	The convergence characteristic of the actual shear stress residual due to global leaders emerging out from different subgroups with iterations for the first side slope of the canal for three different freeboard scenarios with parameter setting 1.	157
Figure 7.6 b	The convergence characteristic of the actual shear stress residual due to global leader emerging out from different subgroups with iteration number for the second side slope of the canal for three different freeboard scenarios with parameter setting 1.	158

Figure 7.7	Characteristics of the overall fish shoal after a computational run involving maximum iteration number for freeboard scenario $f = 0$ with parameter setting 1.	159
Figure 7.8	Characteristics of the overall fish shoal after a computational run involving maximum iteration number for freeboard scenario $f = 0.5$ with parameter setting 1.	160
Figure 7.9	Characteristics of the overall fish shoal after a computational run involving maximum iteration number for freeboard scenario $f = 0.5 y^{0.25}$ with parameter setting 1.	161
Figure 7.10	Characteristics of the overall fish shoal after a computational run involving maximum iteration number for freeboard scenario $f = 0.25+0.25 y^{0.25}$ with parameter setting 1.	162
Figure 7.11	Characteristics of the overall fish shoal after a computation run involving maximum iteration number for freeboard scenario $f = 0.25+0.25 y^{0.5}$ with parameter setting 1.	163
