List of Tables

Table No.	Table caption	Page No.
1.1	Sources of the particulate matter along with their sizes	12
1.2	Mathematical and statistical techniques for source identification and apportionment studies in air pollution	17
3.1	Detail description of sampling locations	48
3.2	Ambient air quality standard	59
3.3a	Comparison of element concentrations with certified values	86
3.3b	Comparison of mercury concentration with certified values	86
3.4	Natural and human–made alpha and beta emitters	92
3.5	Values used for calculating the inhalation annual effective radiation dose due to inhalation of $PM_{2.5}$ and PM_{10} for various age groups	97
3.6	Breathing rates, body weights, and LOAEL values for morbidity	100
3.7	Exposure parameters for uptake through the respiratory system	102
3.8	Reaction parameters for heavy metals entering the human body through the respiratory system	102
4.1	Minimum, maximum, and average concentration of particulate matters and gaseous air pollutants of two consecutive years (2016 & 2017)	111
4.2	Comparison of range and average concentration of major air pollutants of two consecutive years (2016 & 2017)	112
4.3	Average seasonal variation in the concentration of major air pollutants of two consecutive years (2016 & 2017)	119
4.4	Correlation among major air pollutants	131
4.5	Monthly observation of meteorological parameters	134
4.6	AQI values and level of health concerns	137
5.1	Concentration of various elements in particulate matter during two consecutive years (2016 & 2017) at AQMS–01	147
5.2	Concentration of various elements in particulate matter during two consecutive years (2016 & 2017) at AQMS–02	148
5.3	Concentration of various elements in particulate matter during two consecutive years (2016 & 2017) at AQMS–03	149
5.4	Concentration of various elements in particulate matter during two consecutive years (2016 & 2017) at AQMS–04	150
5.5	Concentration of various elements in particulate matter during March, April and May 2016 at AQMS–05	151

5.6	Concentration of various elements in particulate matter during March, April and May 2016 at AQMS–05	152
5.7	Annual average concentration of major, trace elementals and water–soluble ions and enrichment factor in $PM_{2.5}$ at AQMS–01	156
5.8	Annual average concentration of major, trace elementals and water–soluble ions and enrichment factor in PM_{10} at AQMS–01	157
5.9	Annual average concentration of major, trace elementals and water–soluble ions and enrichment factor in SPM at AQMS–01	158
5.10	Annual average concentration of major, trace elementals and water–soluble ions and enrichment factor in $PM_{2.5}$ at AQMS–02	159
5.11	Annual average concentration of major, trace elementals and water–soluble ions and enrichment factor in PM_{10} at AQMS–02	160
5.12	Annual average concentration of major, trace elementals and water–soluble ions and enrichment factor in SPM at AQMS–02	161
5.13	Annual average concentration of major, trace elementals and water–soluble ions and enrichment factor in $PM_{2.5}$ at AQMS–03	162
5.14	Annual average concentration of major, trace elementals and water–soluble ions and enrichment factor in PM_{10} at AQMS–03	163
5.15	Annual average concentration of major, trace elementals and water–soluble ions and enrichment factor in SPM at AQMS–03	164
5.16	Annual average concentration of major, trace elementals and water–soluble ions and enrichment factor in $PM_{2.5}$ at AQMS–04	165
5.17	Annual average concentration of major, trace elementals and water–soluble ions and enrichment factor in PM_{10} at AQMS–04	166
5.18	Annual average concentration of major, trace elementals and water–soluble ions and enrichment factor in SPM at AQMS–04	167
5.19	Correlation coefficient among the concentration value of analyze species in the $PM_{2.5}$ at the study area	188
5.20	Correlation coefficient among the concentration value of analyze species in the PM_{10} at the study area	189
5.21	Correlation coefficient among the concentration value of analyze species in the SPM at the study area	190

6.1	Statistical of the activity concentration of measured isotopes and radium equivalent activity (Raeq) index in particulate matter of different sizes	195
6.2	Correlation among the activity concentration of isotope of potassium, lead, thorium, and uranium with meteorological factors	199
6.3	Average inhalation annual effective radiation dose due to inhalation of $PM_{2.5}$ and PM_{10}	203
7.1	Descriptive analysis of gross alpha and beta activity in the airborne particulate matter of Singrauli coalfield during two consecutive areas (2016–2017)	211
7.2	Comparison of gross α and gross β concentration in airborne particulate matters reported previously	213
7.3	Correlation studies among gross α, gross β, particulate matter and meteorological factors	218
7.4	Calculated total indicative doses from radionuclides for adults [μSv annual^{-1} (8h every day)]	220
8.1	Intake of elements in $PM_{2.5}$ and PM_{10} through inhalation	227
8.2	Dose rates (μg kg^{-1}) for different population age groups in the study area due to air pollutants	232
8.3	Average daily dose or lifetime average daily dose for elements in the $PM_{2.5}$	232
8.4	Average daily dose or lifetime average daily dose for elements in the PM_{10}	233
9.1	Varimax rotated factor loading matrix for the elemental concentrations in $PM_{2.5}$	250
9.2	Varimax rotated factor loading matrix for the elemental concentrations in PM_{10}	251
9.3	Varimax rotated factor loading matrix for the elemental concentrations in SPM	252
10.1	Suspended particulate matter concentration during different mining activities	278
10.2	One–hour average concentration of particulate matter with different wind speed and control method in the laboratory	286
