

TABLES

Table 1.1: Compilation of the mine production and reserves for Li, Co, Ni, Mn, Zn and REs in 2015 (values in ‘000 metric ton)	5
Table 1.2: Rare earth bearing minerals, content availability and deposits	19
Table 1.3: A descriptive list of metal component vis-à-vis secondary resources	24
Table 1.4: Material compositions of some battery types by weight (%)	25
Table 1.5: Composition of spent LIBs after dismantling	28
Table-1.6: Major industrial process for recycling of the lithium ion batteries	31
Table 1.7: Extraction and recovery of metals from spent LIBs in hydrochloric acid system	39
Table 1.8: Extraction and recovery of metals from spent LIBs in sulfuric acid system	40
Table 1.9: Extraction and recovery of metals from spent LIBs in other organic/inorganic acid systems	41
Table 1.10: Composition of various types of Ni-MH batteries	42
Table 1.11: Extraction and recovery of metals from spent NiMH batteries in HCl system	48
Table 1.12: Extraction and recovery of metals from spent NiMH batteries in sulfuric acid system	49
Table 2.1: Chemical composition of cathode active material of spent LIBs	54
Table 2.2: XRD analysis of cathode active material of spent LIBs before processing	55
Table 2.3: Chemical composition of spent Ni-MH battery powder	59
Table 2.4: XRD analysis of NiMH battery material before processing	61
Table 3.1: XRD phase analysis of cathodic material and leach residues at different time interval.	82
Table 3.2: ΔG° for chemical equations in temperature range 308–368 K	90
Table 3.3: XRD phase identification and EDAX analysis of the leach residues at different time with percentage elemental distribution	98
Table 3.4: ΔG° for chemical equations in temperature range 308–368 K	100
Table 3.5 XRD analyses of leach residues obtained from the acid leaching in presence of H ₂ O ₂	108
Table 3.6: XRD analysis of cathode active material after baking and different leaching stages	112
Table 3.7: ΔG° for chemical reactions during baking of cathode active material in temperature range 473-673 K	113
Table 3.8: Effect of various lixivants on the leaching of metals from the baked cathode active powder in leach-I at 95 °C for 120 min	114

Table 3.9: Effect of various lixivants on leaching of residue from leach-I stage at 10% PD, 50 °C, 45 min	119
Table 3.10: ΔG° for chemical equations in the temperature range 273-573 K	121
Table 4.1: The values of apparent rate constants with their correlation coefficients for leaching of Ni-MH powder at different temperatures	147
Table 4.2: XRD phase analysis of electrode material and the leach residues at different time intervals.	151
Table 4.3: XRD phase analysis of the leach residues at different time	164
Table 4.4: EDAX analysis of untreated Ni-MH battery powder and the leach residues with time	166
Table 4.5: XRD analysis of spent Ni-MH electrode material before and after processing	173
Table 4.6: ΔG° for chemical reactions during baking of cathode active material in temperature range 373-673 K	175
Table 4.7: Effect of various lixivants on the leaching of metals from the baked electrode powder	177
Table 4.8: ΔG° for chemical reactions during baking of electrode material in temperature range 303-368 K	180
Table 4.9: Effect of acid, and reductant concentration on leaching of metals from residue of Leach-I at 20 g/L and 95 °C	182
