LIST OF FIGURES

Fig. 1.1:	Gyro-amplifier configurations **(a)** Gyroklystron, **(b)** Gyro-Twystron, and **(c)** Gyro-TWT.	**4**
Fig. 1.2:	Schematic of Gyroklystron amplifier.	**5**
Fig. 1.3:	Illustration of the fields of a TE_{0l} waveguide mode with a superimposed electron beam.	**12**
Fig. 1.4:	Illustration of phase bunching mechanism **(a)** circular electron beam with initial arbitrary phasing of electrons in their cyclotron orbits; **(b)** circular electron beam with phase bunched electrons in their cyclotron orbits.	**14**
Fig. 1.5:	Schematic of a cylindrical two-cavity gyroklystron amplifier.	**18**
Fig. 1.6:	Schematic of a coaxial-cavity in gyroklystron amplifier.	**19**
Fig. 1.7:	Schematic of a clustered-cavity gyroklystron amplifier.	**20**
Fig. 1.8:	Schematic of a frequency-multiplying gyroklystron amplifier.	**21**
Fig. 2.1:	Arrangement of the gyrating electrons in Larmor orbit in the Cartesian as well as cylindrical coordinate systems.	**41**
Fig. 2.2:	Flow chart for time-dependent multimode analysis of gyroklystron.	**58**
Fig. 2.3:	Coupling coefficient as a function of ratio of beam to waveguide radius (R_b/R_w) for operating TE_{02}^2 mode and possible competing modes.	**61**
Fig. 2.4:	Start oscillation current for operating second harmonic mode and possible competing modes as a function of DC magnetic field in the input cavity, where the operating point B_0 = 0.656T and I_b = 20A is indicated.	**62**
Fig. 2.5:	Temporal evolution of RF output power in the different modes in the output cavity of the operating TE_{02}^2 mode **(a)** for a constant RF input power P_{in} = 0.75kW, **(b)** for a ramped RF input power.	**63**

Fig. 2.6:	Temporal evolution of RF power in the input, buncher, and output cavities.	**65**
Fig. 2.7:	RF output power and efficiency as a function of driver frequency.	**65**
Fig. 2.8:	RF output power and gain as a function of driver power.	**66**
Fig. 2.9:	RF output power and efficiency as a function of beam voltage.	**67**
Fig. 2.10:	RF output power and efficiency as a function of beam current.	**67**
Fig. 2.11:	RF output power and efficiency as a function of beam pitch factor.	**68**
Fig. 3.1:	Cross sectional view of the simulation model of the interaction circuit of gyroklystron amplifier.	**78**
Fig. 3.2:	Application of DC Magnetic field along the interaction structure.	**79**
Fig. 3.3:	Mesh distribution along the interaction structure.	**79**
Fig. 3.4:	Implementation of boundary conditions along the interaction structure.	**80**
Fig. 3.5:	Pattern of RF Electric field inside the gyroklystron input cavity **(a)** Contour plot, **(b)** Vector plot, **(c)** Contour plot at the output port.	**81**
Fig. 3.6:	*Q*-factor calculation in the input cavity.	**81**
Fig. 3.7:	Particle emission model.	**83**
Fig. 3.8:	**(a)** Front view of electron beam with 8 beamlets before and after interaction, **(b)** Zoomed beamlet after interaction.	**83**
Fig. 3.9:	Trajectory of electron beam from input port to output port during interaction.	**83**
Fig. 3.10:	Evolution of particles energy along the axes.	**84**
Fig. 3.11:	Contour plot of the electric field pattern of TE_{02} mode along the axial length of the interaction circuit.	**85**
Fig. 3.12:	Temporal growth of the EM signal for the desired TE_{02} mode and the other competing modes.	**85**

Fig. 3.13:	Temporal output power growth in the TE_{02} mode at the output cavity.	**86**
Fig. 3.14:	RF output power and gain variation with driver power (for 65kV beam voltage, 16.2A beam current and 32.32GHz center frequency).	**87**
Fig. 3.15:	Variation of RF output power and efficiency with driver frequency.	**87**
Fig. 3.16:	Variation of RF output power and efficiency with DC magnetic field.	**88**
Fig. 3.17:	Variation of RF output power and efficiency with beam current.	**88**
Fig. 4.1:	Coupling coefficient as a function of ratio of beam to waveguide radii (R_b/R_w) for the different modes.	**97**
Fig. 4.2:	Dependence of voltage depression on beam voltage for different values of beam current.	**101**
Fig. 4.3:	Voltage depression and limiting current versus the ratio of waveguide to beam radii (R_w/R_b).	**102**
Fig. 4.4:	Start oscillation current I_{st} for second harmonic TE_{02} mode and other possible competing modes as a function of DC magnetic field at the output cavity.	**103**
Fig. 4.5:	Start oscillation current I_{st} as a function of DC magnetic field at the output cavity for different values of beam pitch factor.	**104**
Fig. 4.6:	Analytical temporal power growth obtained by developed multimode analysis for the operating second harmonic TE_{02} mode along with the possible competing modes (for B_0 = 2.74T and P_{in} = 1W).	**106**
Fig. 4.7:	Simulated view of the cross-section of the gyroklystron interaction circuit.	**107**
Fig. 4.8:	Electric field pattern at the input cavity of gyroklystron: **(a)** Contour plot, **(b)** Vector plot, and **(c)** Contour plot at the output port.	**109**
Fig. 4.9:	Q-factor calculation in the output cavity.	**110**
Fig. 4.10:	Front view of electron beam with 8 beamlets **(a)** before interaction, **(b)** after interaction.	**111**

Fig. 4.11: Contour plot of the electric field pattern of TE_{02} mode along the axial length of interaction circuit. **112**

Fig. 4.12: Evolution of the particles energy along the axial length of the interaction circuit. **112**

Fig. 4.13: Frequency spectrum of electric field amplitude to determine the operating frequency of the gyroklystron amplifier. **113**

Fig. 4.14: Temporal growth of the EM signal in the operating $TE_{02}^{(2)}$ mode along with the other competing modes. **113**

Fig. 4.15: PIC simulation plot for the temporal growth of the RF output power in the operating $TE_{02}^{(2)}$ mode. **114**

Fig. 4.16: RF output power and gain variation with input drive power (P_{in}) (V_b = 40kV, I_b = 1A, α = 1.5, and f_{dr} = 140GHz). **114**

Fig. 4.17: Analytical and simulated RF output power variation with the driver frequency (V_b = 40kV, I_b = 1A, α = 1.5 and B_0 = 2.74T). **115**

Fig. 4.18: RF output power and efficiency variation with DC magnetic field. **116**

Fig. 4.19: RF output power and efficiency variation with the beam voltage (I_b = 1A, α = 1.5, f_{dr} = 140GHz). **117**

Fig. 4.20: RF output power and efficiency variation with the beam current (V_b = 40kV, α = 1.5). **117**

Fig. 5.1: Schematic of a two-clustered gyroklystron amplifier. **123**

Fig. 5.2: **(a)** Field amplitude versus frequency in the input cavity and input cluster, **(b)** in the output cavity and output cluster of a conventional cavity and clustered cavity gyroklystron amplifier. **131**

Fig. 5.3: RF output power versus frequency in case of conventional cavity [Zasypkin *et al*. (1996)], and clustered-cavity gyroklystron amplifier (for a 72kV, 14A electron beam and 3.5kW input power). **131**

Fig. 5.4: Variable part of gain $G_{ss}^{(\mathrm{var})}$ versus normalized frequency detuning in the absence of stagger tuning between clusters (variable ξ_1 and ξ_2 indicate the stagger tuning in the input and output clusters respectively). **132**

Fig. 5.5: **(a)** Schematic of a two-cavity conventional gyroklystron amplifier, **(b)** Schematic of a two-clustered gyroklystron **133**

amplifier.

Fig. 5.6: Axial field structure of clustered-cavity subunit resonating in the TE_{02} mode. **134**

Fig. 5.7: Contour plot of the electric field pattern of TE_{02} mode along the axial length of interaction circuit. **134**

Fig. 5.8: Temporal growth of RF output power in case of clustered cavity gyroklystron amplifier. **135**

Fig. 5.9: Gain as a function of frequency in case of conventional cavity, and clustered-cavity gyroklystron. **136**
