

## LIST OF TABLES

---

---

- Table1.1.**Production of L-glutaminase from different bacteria, fungi and yeast
- Table2.1.**Biochemical properties of glutaminase produced from different bacteria, yeast and fungi
- Table2.2.**Extractive fermentative production of different biomolecules using ATPS
- Table3.1.**Optimization of assay parameters of L-glutaminase from *Bacillus cereus* MTCC 1305 using RSM and ANN methodologies
- Table3.2.**Estimation of L-glutaminase activity among different bacterial strains
- Table3.3.**Central composite design for five variables with actual experimental and predicted activity of L-glutaminase using RSM and ANN methodologies
- Table3.4.** Regression analysis of central composite design showing model coefficients and significance of regression coefficient for glutaminase activity
- Table3.5.**Results of Analysis of Variance (ANOVA) for analyzing model fitness of L-glutaminase activity
- Table3.6.**Weight and bias values of nonlinear function at optimum assay parameters to estimate glutaminase activity in ANN methodology
- Table4.1.**Optimization of cultural conditions using statistical tools like response surface methodology and artificial neural network
- Table4.2.**Optimization of media components using response surface methodology and artificial neural network statistical tools
- Table4.3.**Central composite design for six variables and experimentally determined actual data, predicted data by RSM and ANN for L-glutaminase production
- Table4.4.**Regression analysis of central composite design showing model coefficients and significance of regression coefficient
- Table4.5.**Analysis of Variance (ANOVA) for analyzing model fitness for L-glutaminase production at optimum cultural parameters
- Table4.6.**Weight and bias values of nonlinear function of cultural parameters for prediction of glutaminase activity using ANN methodology
- Table4.7.**Plackett Burman design matrix for eight factors with the experimental and predicted activity of L- Glutaminase

- Table4.8.** Statistical analysis of the Plackett Burman design showing coefficient, test value (T), and Probability (P) for each variable
- Table4.9.** Experimental design matrix for five significant media components with actual and predicted activity of L-glutaminase using BBD and ANN tools
- Table4.10.** Model coefficients estimated by multiple linear regressions for L-glutaminase production
- Table4.11.** ANOVA analysis for model fitness for production of L-glutaminase at optimum media components
- Table4.12.** Weight and bias values of nonlinear function at optimum media components
- Table6.1.** Partitioning of L-glutaminase from *Bacillus cereus* in different PEG2000/salt and PEG2000/dextran system
- Table6.2.** Partitioning of L-glutaminase from *Bacillus cereus* in PEG4000/salt and PEG4000/dextran system
- Table6.3.** Partitioning of L-Glutaminase from *Bacillus cereus* in PEG6000/salt and PEG6000/dextran system
- Table6.4.** Effect of phase volume ratio ( $V_v/V_b$ ) on partitioning of L-glutaminase in PEG4000/DextranT500 system
- Table6.5.** Comparative analysis for production of L-glutaminase from *Bacillus cereus* MTCC 1305 in homogeneous fermentation and PEG4000/dextranT500
- Table7.1.** Purification of L-glutaminase from *Bacillus cereus* MTCC 1305
- Table7.2.** Effect of metal ions, chelator, reducing agents, and thiol-binding agents on activity of purified L-glutaminase from *Bacillus cereus* MTCC 1305
- Table7.3.** Substrate specificity of purified L-glutaminase from *Bacillus cereus* MTCC 1305
- Table7.4.** Deactivation kinetics parameters enthalpy ( $\Delta H$ ), free energy ( $\Delta G$ ), Entropy ( $\Delta S$ ) and  $t_{1/2}$  (half life) of the purified L-glutaminase from *Bacillus cereus* MTCC 1305
- Table8.1.** Total peptide sequences of purified L-glutaminase from *Bacillus cereus* MTCC 1305 after MALDI-TOF analysis
- Table8.2.** Peptide sequences for six peaks of L-glutaminase from *Bacillus cereus* MTCC 1305 with their expected molecular weight
- Table8.3.** Multiple Multiple sequence alignments of L-glutaminase from different

*Bacillus* spp. using clustal W 2.0.12 software tool

**Table8.4.** Alignment of L-glutaminase sequences from *Bacillus cereus* MTCC 1305 with template sequences of *Bacillus subtilis* (PDB:1MKI\_A). The conserved residues were represented by “h” and semi conserved substitution was represented by “s” in sequence alignment

**Table8.5.** Physicochemical properties of predicted model structure of L-glutaminase from *Bacillus cereus* MTCC 1305 after using ExPASy's ProtParam tool

**Table8.6.** Amino acid composition for predicted model structure of L-glutaminase from *Bacillus cereus* MTCC 1305

**Table8.7.** Z score analysis of protein structure in term of pseudo energies level and QMEAN 4 with respect to raw score obtained for high resolution experimental structure of similar size solved by X-Ray crystallography
