

CERTIFICATE

It is certified that the work contained in the thesis titled 'Pyrolysis behaviour of low value biomass towards renewable fuel and valuable chemicals' by Ahmad Nawaz has been carried out under my supervision. This work has not been submitted elsewhere for a degree. It is further certified that the student has fulfilled all the requirements of the comprehensive examination, Candidacy, and SOTA for the award of Ph. D. degree.

Supervisor 16/8/22

Dr. Pradeep Kumar (Associate Professor)

Associate Professor
Department of Chemical Engineering & Technology
Dept. of Chemical Engg. & Tech.
Indian Institute of Technology
Benaras Institute of Technology
Benaras Hindu University
Varanasi/Varanasi

DECLARATION BY THE CANDIDATE

I, **Ahmad Nawaz**, certify that the work embodied in this thesis is my bonafide work and carried out by me, under the supervision of **Dr. Pradeep Kumar** from **December 2017 to August 2022** at the 'Department of Chemical Engineering & Technology,' Indian Institute of Technology (BHU), Varanasi. The matter embodied in this thesis has not been submitted for the award of any other degree/diploma. I declare that I have faithfully acknowledged and given credits to the research workers wherever their works have been cited in my work in this thesis. I further declare that I have not willfully copied any other's work, paragraphs, text, data, results, etc., reported in journals, books, magazines, reports, dissertations, thesis, etc., or available on websites and have not included them in this thesis and have not cited as my work.

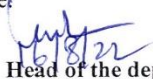

Date: 16/8/22

Place: Indian Institute of Technology (BHU), Varanasi

Ahmad Nawaz
(Ahmad Nawaz)

CERTIFICATE FROM THE SUPERVISOR

It is certified that the above statement made by the student is correct to the best of my knowledge:

Head of the department

Prof. V.L. Yadav
Department of Chemical Engineering & Technology
Indian Institute of Technology (BHU)
Varanasi - 221005, India
काशी हिन्दू विश्वविद्यालय / Banaras Hindu University
वाराणसी / Varanasi-221005

Supervisor

Dr. Pradeep Kumar (Associate Professor)
Department of Chemical Engineering & Technology
Indian Institute of Technology (BHU),
Varanasi - 221005, India
Banaras Hindu University
वाराणसी / Varanasi-221005

COPYRIGHT TRANSFER CERTIFICATE

Title of the Thesis: ‘Pyrolysis behaviour of low value biomass towards renewable fuel and valuable chemicals’

Name of the Student: **Ahmad Nawaz**

Copyright Transfer

The undersigned hereby assigns to the Indian Institute of Technology (Banaras Hindu University) Varanasi all rights under copyright that may exist in and for the above thesis submitted for the award of the **DOCTOR OF PHILOSOPHY**

Date: 16/08/2022

Place: Indian Institute of Technology (BHU), Varanasi

(**Ahmad Nawaz**)

Note: However, the author may reproduce or authorize others to reproduce material extracted verbatim from the thesis or derivative of the thesis for the author’s personal use provided that the source and the institute’s copyright notice are indicated.

ACKNOWLEDGEMENT

I am very grateful to my supervisor **Dr. Pradeep Kumar** for his consistent help, encouragement, valuable discussions, and faith in me during the entire period of my research work. I would not have been able to complete this thesis without his utmost involvement and invaluable efforts. He motivated me to pursue research problems and the need for persistent effort to accomplish the goal. He is the real definition of the best teacher, friendly and behind for all problems of not only mine but all students. Besides my supervisors, I would like to thank RPEC members: **Prof. V.L Yadav** and **Dr. Vishal Mishra** for their insightful comments and encouragement.

I sincerely thank **Prof. V.L Yadav**, Head of the Department of Chemical Engineering & Technology, and the former Head, **Prof. P.K Mishra**, for providing all the research facilities to accomplish my research in the Department. My sincere thanks are also to all the respected faculty members of the Department of Chemical Engineering & Technology for their constant inspiration and valuable suggestions.

My special thank goes to **Prof. S.N Upadhyay**, Emeritus Professor, Department of Chemical Engineering & Technology, IIT (BHU), who taught me a lot during the entire journey to convert the present work into the shape of a thesis.

I am thankful to all my seniors/juniors and friends **Vikas Kumar Pandey, Shivesh Sabbarwal, Shyam Sunder Rao, Ganesh swain, Bineeta Singh, Vivek Patel, Satyansh Singh, Tapas Das, Anuj Prajapati, Ravi Saini, Sanjeev Verma, Sharvan Kumar**, and **Dheeraj Jaiswal** for their constant encouragement and making joyful and memorable moments at IIT (BHU), Varanasi.

I am also thankful to all the lab and workshop staff, specially **Shri Chandralal Ji, Shri Vinay Kumar Ji, Shri Lal Bahadur Ji, Shri Umesh Singh Ji, Shri Varun Ji, Shri Ankit Ji**, and all the office staff. I would also like to extend my heartiest thanks to **Prof. Rajiv Prakash**

(Prof.-in-charge, CIFIC) and his technical team, especially **Mr. Durgesh Prasad Gupta**, for providing the research facilities. I would also like to acknowledge **AIRF (JNU), New Delhi, India**, for providing the GCMS facility.

I would also like to acknowledge the **Ministry of Human Resource Development (MHRD), New Delhi, India**, and **Scheme for Promotion of Academic and Research Collaboration (SPARC), India**, for financial support.

Last but not least, I would like to express my deepest gratitude to my family and my parents for giving my life in the first place, educating me, and for their unconditional support and encouragement to pursue my interest.

I also wish to thank all my friends and the person whose names have not been mentioned on this piece of paper for extending their cooperation directly or indirectly.

My Beloved Parents

Table of Content

Chapter-1 Introduction	1
1. Introduction	1
1.1 Biomass	7
1.2 Chemical composition of biomass	8
1.2.1 Cellulose	9
1.2.2 Hemicellulose	9
1.2.3 Lignin	9
1.2.4 Extractives	10
1.3 Technologies for converting biomass to energy	11
1.3.1 Biochemical conversion technologies	11
1.3.2 Thermochemical conversion technologies	12
Chapter-2 Literature Survey	17
2.1 Biomass classification	18
2.2 Physicochemical characterization of biomass	19
2.3 Kinetic analysis of biomass	19
2.4 Pyrolysis of biomass	20
2.5 Bio-oil yield operating parameters for biomass pyrolysis	22
2.5.1 Temperature	22
2.5.2 Heating rate	23
2.5.3 Carrier gas (Inert) flow rate	24
2.5.4 Feedstock size	24
2.5.5 Residence time	25
2.6 Response surface methodology (RSM)	25
2.7 Products of pyrolysis	27
2.7.1 Pyrolytic liquid (Bio-oil)	27
2.7.2 Pyrolytic gases	28
2.7.3 Solid product (Biochar)	28
2.8 Knowledge gaps and hypothesis	29
2.9 Aim and Objectives	29
Chapter-3 Material and methods	31
3. Introduction	32
3.1 Collection and preparation of biomass	32
3.2 Physicochemical characterization and thermal degradation studies	33
3.2.1 Proximate study	33
3.2.2 Ultimate analysis	34
3.2.3 Calorific value	35

Table of Content

3.2.4 Bulk density	35

MCT	Molecular collision theory

List of symbols

Symbol	Nomenclature
A	Pre-exponential factor (s^{-1})
T	Temperature (degree Celsius or kelvin)
E	Activation energy (kJ/mol)
E_{α}	Activation energy (variation with conversion)
α	Conversion
t	Time (second or minute)
K(T)	Temperature dependent rate constant
m_i	Initial weight
m	Instantaneous weight
m_{∞}	Final weight
R	Universal gas constant (8.314 J/mol.K)
β	Heating rate ($^{\circ}\text{C}/\text{min}$)
$f(\alpha)$	Reaction model based function of conversion
$g(\alpha)$	Integral conversion function
C	Constant
ΔG	Change in Gibb's free energy (kJ/mol)
ΔH	Change in enthalpy (kJ/mole)
ΔS	Change in entropy (J/mol.K)
h	Plank's constant (6.626×10^{-34} Js)
K_b	Boltzmann constant (1.381×10^{-23} J/K)
T_m	Peak temperature
R^2	Regression coefficient

Preface

Energy is regarded as a critical component for the worldwide development and financial prosperity of present-day society. However, rising energy use in recent years has resulted in issues such as depletion of fossil-based energy resources and ecological destruction. The agricultural, industrial, transportation, and residential sectors have an increased energy demand. Over the last two to three decades, significant global research and development efforts have been devoted to developing different renewable energy supplies to meet energy demand while decreasing environmental challenges. Renewable energy resources such as biomass, solar, wind, and hydro have been identified as potential possibilities for a country like India. Lignocellulosic biomass has received substantial consideration over other renewable energy resources due to its inherent advantages. Biomass has drawn the attention of policymakers and academics worldwide among the many categories of renewable energy sources because of its renewable and sustainable character and its continuous and extensive availability in various forms. In this thesis, three different types of low-value biomass such as *Lagerstroemia speciosa* (LS), mustard straw (MS), and *Sesbania bispinosa* (SB), were chosen as a feedstock for pyrolysis in order to determine their bioenergy potential. The LS biomass was collected from the campus of IIT (BHU) Varanasi, whereas the MS and SB biomass was collected from the village (Bindwal) of Azamgarh district, Uttar Pradesh, India. The samples were dried and then powdered to get the desired particle size. Further, physicochemical characterization such as proximate, ultimate, and fiber analyses were carried out. The calorific value and bulk density were also measured to determine the energy content and ease in storage and transportation, respectively. The FTIR spectroscopy was carried out to determine the different functional groups attached to the respective biomasses, whereas thermogravimetric analysis was carried out to determine the thermal stability of the biomass.

Preface

Chapter-1 deals with the introduction of energy scenario in India. This chapter describes the production and consumption of different petroleum products in India. Further, the classification and properties of the available biomass resources have been described. The chemical composition of the biomass, such as hemicellulose, cellulose, and lignin, and the technologies applied for converting biomass into valuable products were presented.

Chapter-2 mainly deals with the physicochemical characteristics of different types of biomasses reported in previously published literature. The kinetic analysis of different types of biomasses using different models was studied. The thermal pyrolysis based on different operating conditions of various types of biomass and their optimum pyrolytic yield were presented. The yield of pyrolysis products, for example, type of biomass, catalyst employed, heating rate, feedstock size, sweeping gas (N₂) flow rate, reactor layout, and temperature, were studied. The pyrolysis products were optimized using response surface methodology (RSM) based on central composite design (CCD). The research gaps were identified from the literature. The scope and objectives of the present research work are described.

Chapter-3 deals with material and methods, collection, and preparation of the biomass. The preliminary characterization of the sample such as proximate analysis (moisture content, volatile matter, ash, and fixed carbon content), ultimate analysis (carbon, hydrogen, nitrogen, and sulfur), calorific value, bulk density, fiber analysis (cellulose, hemicellulose, and lignin) were carried out using the standard protocols, whereas thermal degradation analysis was carried out using a thermogravimetric analyzer. Fourier transform infrared spectroscopy (FTIR) was employed for the determination of functional groups present in the biomass. The kinetic and thermodynamic parameters were also calculated using the respective equations. This chapter also comprises the details of the experimental setup used in different experimental works.

Chapter-4 aims to investigate the thermochemical characteristics and thermal degradation behavior of LS biomass. LS sample was characterized by proximate study, elemental study, calorific value, fiber analysis, and thermal stability study, whereas; isoconversional models such as Ozawa-Flynn-Wall (OFW), Kissinger Akahira Sunose (KAS), Vyazovkin (VZK), Tang method (TM), and Starink method (ST) were used for performing the kinetic study. The physicochemical study of LS revealed its bioenergy capability to create renewable fuel and valued compounds. Further, isoconversional models such as OFW, KAS, TM, ST, and VZK yielded average activation energy of 164, 154.35, 154.63, 154.61, and 141.93 kJ/mol. The master plot and thermodynamic study of LS confirmed that the pyrolysis process passed through multifaceted reaction mechanisms. Important pyrolysis parameters such as heating rate, temperature, and inert gas (N₂) flow rate were optimized using the Response Surface Methodology (RSM). The experimental findings revealed that the optimum condition for the maximum bio-oil yield (45.6%) production was: temperature = 550°C, heating rate = 65°C/min, and N₂ flow rate = 60ml/min; however, at this condition, the predicted bio-oil yield using RSM was 44.98%. The obtained bio-oil was characterized based on its physicochemical properties such as GCMS, FTIR, and ¹H-NMR.

Chapter-5 aims to investigate the thermochemical characteristics and thermal degradation behavior of mustard straw. The model-free methods of Ozawa-Flynn-Wall (OFW), Kissinger Akahira Sunose (KAS), and Vyazovkin were employed for kinetic analysis and Coats-Redfern (CR) method was employed for elucidating the reaction mechanism. Response surface methodology (RSM) with a central composite design technique was employed to optimize the pyrolysis process parameters to gain the maximum amount of bio-oil. The highest bio-oil yield (44.69%) was obtained at the heating rate of 25 °C/min and a temperature of 500°C under inert conditions (N₂ gas flow rate=100 ml/min). Further, FTIR and GCMS analysis of bio-oil revealed the presence of different functional groups

Preface

and valuable chemicals, whereas physicochemical characterization revealed its fuel characteristic. The results confirmed the suitability of mustard straw as a feedstock for obtaining cleaner fuel and value-added products.

Chapter-6 deals with the aim of optimizing the process parameters and experimental situations for the pyrolysis of *Sesbania bispinosa* (SB) to acquire the utmost bio-oil yield. A stainless steel fixed bed reactor was employed for pyrolysis to attain the pyrolysis product. The thermogravimetric analyzer (TGA) was employed to measure the thermal degradation profile at dynamic heating rates. The model-free approaches of Ozawa Flynn Wall (OFW), Kissinger Akahira Sunose (KAS), Tang (TM), Starink (ST), and Vyazovkin (VZK) were used to predict kinetic parameters. The average activation energy obtained was 181.37, 180.63, 180.91, 180.90, and 161.31 kJ/mol using the OFW, KAS, TM, ST, and VZK methods, respectively. The thermal pyrolysis results revealed that the highest bio-oil yield (42.53 wt. %) was achieved at a temperature of 585 °C, a heating rate of 60 °C/min, and an inert flow rate of 125 ml/min. Characterization results of biochar confirmed its candidacy to be used in different industrial applications.

Chapter-7 presents the overall summary, including important conclusions and the scope of future work.
