
CERTIFICATE

It is certified that the work contained in the thesis titled “**A study of novel approaches for improved prediction of pillar stability in underground mines** ” by “**BRIJESH KUMAR**” has been carried out under our supervision and this work has not been submitted elsewhere for a degree. It is further certified that the student has fulfilled all the requirements of Comprehensive Examination, Candidacy and SOTA for the award of Ph.D. Degree.

Supervisor

Prof. Sanjay Kumar Sharma

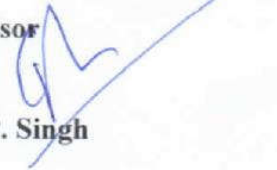

Department of Mining Engineering

Indian Institute of Technology

(Banaras Hindu University)

Varanasi-221005, INDIA

Co-supervisor

Dr. G. S. P. Singh

Department of Mining Engineering

Indian Institute of Technology

(Banaras Hindu University)

Varanasi-221005, INDIA

DECLARATION BY THE CANDIDATE

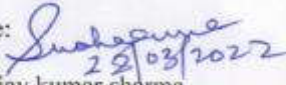

I, "**BRIJESH KUMAR**", certify that the work embodied in this thesis is my own bonafide work and carried out by me under the supervision of "**PROF.SANJAY KUMAR SHARMA**" and co-supervision of "**DR. G.S.P.SINGH**" from "**JULY 2015**" TO "**DECEMBER 2021**", at the "**DEPARTMENT OF MINING ENGINEERING**", Indian Institute of Technology (BHU), Varanasi. The matter embodied in this thesis has not been submitted for the award of any other degree/diploma. I declare that I have faithfully acknowledged and given credits to the research workers wherever their works have been cited in my work in this thesis. I further declare that I have not wilfully copied any other's work, paragraphs, text, data, results, *etc.*, reported in journals, books, magazines, reports dissertations, theses, *etc.*, or available at websites and have not included them in this thesis and have not cited as my own work.

Date: *march 2022*
Place: Varanasi

ACKNOWLEDGEMENTS

Through this page, I offer my salutation to Mahamana Pt. Madan Mohan Malviya Ji, the creator of this pious seat of learning.

It is indeed my proud privilege to express my deep sense of gratitude, respect, indebtedness and sincere regards to my Supervisor, **Prof.Sanjay kumar Sharma**, for his excellent supervision, skilled and valuable guidance, stimulating discussion, unflinching support, immense help, and constant encouragement over the entire period of my association with him. I am grateful to him for his sincere concern both for academics and personal welfare and parental care throughout the research period that he has extended to me for the successful completion of my research work. I am proud to have a teacher like him who is always motivative and supportive, even in most adverse situations. In fact, he has been a source of inspiration for me to have an optimistic approach in life and do my best.

I wish to express my heartfelt thanks to Dr.G.S.P.Singh for his immense support encouragement and providing technical knowledge throughout my research work.

I wish to express my heartfelt thanks to the Head and DPGC Convener and my internal RPEC member, of the Department of Mining Engineering, Indian Institute of Technology (Banaras Hindu University), Varanasi, for his constant support and blessings.

I am thankful to Dr. Nawal Kishore my internal RPEC member, Department of Mining Engineering, IIT (BHU) for giving me valuable suggestions throughout my research period.

I am thankful to and Prof. P.K.Mishra my external RPEC member, Department of Chemical Engineering, IIT (BHU) for giving me valuable suggestions throughout my research period.

I have been highly blessed with a friendly and cheerful group of fellow research scholars. I would like to express my heartfelt gratitude to especially Mr. Anand Kumar, Mr.Punit Paurush, Dr. Anoop Kumar Tiwari, Pusker Singh, Dr. Bablesh Jha, Ujjwal Kumar Singh, Dr. Somveer Singh Rathore, Dr. SS Tiwari, Dr. HK Singh, Shivanshu Shekhar, and Ashish Viswakarma, who directly or indirectly supported my research work. Their companionship and lively discussions in and outside the laboratory were great sources of inspiration.

I have been highly blessed with some lovely Juniors Prasant Modi, Shashank Tripathi, Aditya, Vibhav, and Shashank Shekhar who always helped and created a positive environment during my research work.

Words plunge insufficient to express my regards and deep emotions to my family specially my sisters for being the source of unconditional love and inspiration to move on the way to my goal of achieving higher education. Their everlasting encouragement, patience, sacrifice and blessings have brought me up to this stage. My mother earthly God deserve much more than what I can express in words. I cannot forget to pay gratitude to my late father who inspired me to reach this stage.

I express my heartfelt thanks to Ms. Ankita for her continuous support, encouragement, and motivation throughout entire my research work.

I would like to express my gratitude to the Department of Mining Engineering, IIT (BHU), Varanasi for providing me with the necessary facilities for conducting my research work smoothly.

Finally, I bow my head humbly before the almighty Kashi Vishwanath Baba, without whose consent and blessings, this work would have been impossible.

(BRIJESH KUMAR)

ABSTRACT

Support pillars are an essential structure found throughout the mining industry. The primary purpose of such pillars is to provide stability during the extraction of ores. The traditional method of determining pillar stability is to calculate the safety factor, defined as the ratio of pillar strength to pillar load. The pillars are considered to have failed when the safety factor falls below one. Various methodologies, such as tributary area theory, numerical modelling, and other computational methods, are used to estimate the pillar load. Similarly, empirical equations obtained from the examination of failed and stable situations can be used to determine the strength of the pillars. As the mining advances deeper, pillar failure becomes more common and critical because of the significant increase in ambient loads. Because of their relevance in the safe and cost-effective extraction of underground ores, mine pillars and their design have been examined by several researchers.

Every generation of rock engineers has tried to establish the best ways for effective designs for pillars. However, no ideal solution has yet been found to incorporate all of the essential variables contributing to the pillars' stability mechanics. Even the interaction of these parameters on mine pillar mechanics is subject to ongoing adjustment. Recently, mathematical techniques and software have been successfully used to analyze the relative influence of this multi-parametric phenomenon.

Over the past decades, deterministic (empirical, statistical, or analytical) methods for estimating mine pillar stability have been developed. Researchers have been very much attracted to machine learning algorithms(ANN) and statistical tools such as PCA, SSE techniques.

Given the above, the main objective of this thesis is to :Investigate the suitability of different machine learning (ML) algorithms to predict pillar stability of hard rocks in underground mining. Develop a robust and transparent model explaining the impact of features and simultaneously for the assessment and final prediction of the stability of the support pillars.

The collateral objectives are: To develop a research methodology for the comparison of the performance of different Supervised Learning (SL) algorithms Feature ranking to obtain the discriminating ability of different features in the prediction of pillar stability. To investigate the relative importance of influencing variables affecting pillar stability in underground mining. To select pillar stability parameters affecting factor of safety by Principle Component Analysis (PCA) and Step-wise Selection and Elimination (SSE) techniques in underground mines, and to develop a suitable model using PCA and SSE for statistical analysis and validate the obtained equation or model with the remaining data.

This study attains significance in light of newer challenges posed to underground mining. As underground mining is getting deeper, the risk and cost of production are also at high risk. To handle these risks, we need to study the challenges like rockbursts, gas outbursts and redistributed stresses etc., posed by the pillars in underground mining, reduce risk factors, and increase production. As we move into the new digital era, the rise of novel approaches like artificial intelligence, PCA, and soft computing has entered every research field. The studies of these methods could give valuable ideas in improving the understanding of pillar stability in underground mining, further reducing the risk and increasing ores production.

Machine learning algorithms and Statistical tools such as PCA, SSE ANN, etc.,

were used to understand the pillar stability conditions and improve the prediction performance of pillar stability of underground mines. For the prediction of pillar stability (PS), two input parameters, namely, w/h ratio (pillar width to pillar height) and the ratio of average induced pillar load (PL) over the uniaxial compressive strength (UCS) of the intact rock (PL/UCS) has been used. The output of pillar stability is characterized into three classes: a). Stable b). Unstable and c). Failed

Three principles for selecting parameters have been relied upon for establishing the classification models. Firstly, the sensitive and stable parameters reflecting properties of pillar stability should be used as the discriminant indicators. Secondly, the parameters should be physically independent of each other. Finally, the parameter data should be obtained easily or readily available.

Due to the importance of features, the feature ranking algorithm, namely: fuzzy rough attribute evaluator, was used to obtain the rank of the features in the classification task. Experiments were conducted using various classification algorithms, namely Naïve Bayes, PART, Jrip, SMO, and Random Forest(RF), by changing the number of features from most significant to least significant.

The relative evaluation of the prediction of the five machine learning algorithms was performed by utilizing threshold-dependent and threshold-independent parameters. These parameters were calculated from the values of the confusion matrix, namely: True Positives (TP) (the number of correctly predicted pillar stability), False Negatives (FN) (the number of incorrectly predicted pillar stability), True Negatives (TN) (the number of correctly predicted pillar un-stability with failure) and False Positives (FP) (the number of incorrectly predicted pillar un-stability with failure). Accuracy, Area under the curve (AUC), and Mathew's

correlation coefficient (MCC) were determined for each case. The Receiver Operating Curve (ROC) was used to represent the classifiers visually.

From the present research, the following conclusions have been drawn:

The best performance was produced by Random Forest with an accuracy of 83.3%, AUC of 0.920, and MCC of 0.740. Ranking of different features based on fuzzy rough feature evaluator in which pillar width to pillar height ratio got the maximum rank value of 0.04185 this shows the importance of this feature. The PCA technique selected two important parameters affecting Pillar Strength, W/H and UCS. On the other hand, the SSE technique selected W/H and B(Gallery Width). The R^2 value for the developed model using PCA in predicting pillar strength was 0.86, and the root mean square error was 0.112. Similarly, for SSE, it was 0.84 and 0.123, respectively. The PCA has a better ability to predict the pillar strength. The validation performed on the proposed model by PCA and SSE (using the datasets shown in Table B of the annexure) showed that we can express a higher level of statistical assurance on the proposed models. PCA has better accuracy in the prediction of Factor of safety (FoS). The comparison curve for FoS strengthens the result that the PCA has higher assurance in the prediction of FoS than SSE.
