

LIST OF TABLES

Table 3. 1:	Different raw material particle size distribution using mesh.	43
Table 3. 2:	Show the code for different composition and corresponding level of addition.	44
Table 3. 3:	Measured value of different porcelain insulator composition physical properties with sintering temperature and addition of silica in wt. %.	53
Table 3. 4:	Measurement of dielectric strength of different samples composition.	61
Table 4. 1:	Shows the code for the formulation applied and the corresponding level of addition (taken in wt. %).	65
Table 4. 2:	Particle size distribution of raw material.	66
Table 4. 3:	Show the X-Ray Diffraction analysis to identified different phases formed during sintering at 1350°C.	73
Table 4. 4:	Show the crystallite size of different samples.	74
Table 4. 5:	The value of the change in L.S (in %), W.A (in %), A.P (in %) and B.D (in g/cm ³) after addition of zirconia with different sintering temperatures.	80
Table 4. 6:	The calculated value of Modulus of Rupture (MOR) and compressive strength of different samples with temperatures.	82
Table 4. 7:	The measured experimental value of an AC electrical resistivity ($\rho_{a.c}$) and conductivity ($\sigma_{a.c}$) of samples (sintered at 1350°C) with frequency variation (Hz to MHz).	87
Table 4. 8:	The experimental values of dielectric and loss ($\tan\delta$) values of different porcelain samples in Microwave Frequency.	88
Table 4.9:	Measurement of dielectric strength of different sample composition.	91
Table 5. 1:	Batch codes with their composition (weight %).	97
Table 5. 2:	Particle size distribution of raw materials.	97

Table 5. 3:	Show the crystallite size of sintered samples at 1350°C with a soaking period of 2 hours.	102
Table 5. 4:	Shown the average grain and pore size of the samples.	103
Table 5. 5:	Physical properties of different composition (D1, D2, D3, D4 and D5) with zirconia wt. % sintered at 1350°C.	106
Table 5. 6:	The dependence of dielectric constant tangent dielectric loss ($\tan\delta$) on the frequency (Hz) and addition of zirconia wt. % for the samples sintered at 1350°C.	112
Table 5. 7:	The dependence of resistivity and conductivity on the frequency (Hz) and addition of zirconia wt. % for the samples sintered at 1350°C.	114
Table 5. 8:	Measurement of dielectric strength of the different samples composition.	118
Table 6. 1:	Variation of ZrO_2 and $BaTiO_3$ in the base composition.	125
Table 6. 2:	The B.D (in g/cc), A.P (in %), L.S (in %), W.L (in %) and W.A (in %) with content of BT (0–2 wt. %) sintered at 1350°C with soaking period for 2 hours.	134
Table 6. 3:	The calculated value of Modulus of Rupture (MOR) and compressive strength of different samples with temperatures.	136
Table 6. 4:	Measurement of dielectric strength of the different samples composition.	142
